

Level 9 – Measurement and geometry

Overview

Task name	When three sides work
Learning intention	To explore Pythagoras's theorem and the relationship between the sides of triangles and their lengths
Duration	30 minutes

Links to the Victorian Curriculum

These work samples are linked to [Level 9](#) of the Mathematics curriculum.

Extract from achievement standard

Apply Pythagoras's theorem ... to solve problems involving ... lengths in right-angled triangles.

Relevant content description

- Investigate Pythagoras' Theorem and its application to solving simple problems involving right-angled triangles (VCMMG318)

Links to NAPLAN

Minimum standards – numeracy

[Year 9: Classification and properties of shapes](#)

Students can classify 2D shapes ... according to common properties including ... sides, perimeters, areas ...

Student work samples – Constructing triangles

These work samples were created by students working at Level 9. Evidence of student achievement has been annotated.

Victorian Curriculum link

Investigate Pythagoras' Theorem and its application to solving simple problems involving right-angled triangles (VCMMG318)

Part 1

- a. Construct a triangle with side lengths of 5, 6 and 8 centimetres.

Uses a ruler to draw a triangle with required side lengths

Labels sides with correct measurements, including units

Part 1

- a. Construct a triangle with side lengths of 5, 6 and 8 centimetres.

Uses a ruler and compass to construct a triangle with required side lengths

Labels sides with correct measurements but without units

Mathematics – Annotated student work samples

- b. Let p, q and r be three positive integers. Find a relation between p, q and r which means that these numbers could represent the lengths of the three sides of a triangle, for any kind of triangle.

$P+q$ must be greater than r

Uses symbols and words to specify the relation, assuming r corresponds to the longest side

- b. Let p, q and r be three positive integers. Find a relation between p, q and r which means that these numbers could represent the lengths of the three sides of a triangle, for any kind of triangle.

$q+p > r$ the sum any two side of a triangle

$r+q > p$ MUST larger than the third side.

$P+r > q$

Uses symbolic expressions including inequality to write a set of relations independent of the relative magnitudes

- b. Let p, q and r be three positive integers. Find a relation between p, q and r which means that these numbers could represent the lengths of the three sides of a triangle, for any kind of triangle.

let $r =$ the hypotenuse
 p and q are the other two sides

you can work out the side length of r
 if you have p and q by using Pythag

eg. $p=5, q=10$

$$5^2 + 10^2 = r^2$$

$$125 = r^2$$

$$r = \sqrt{125}$$

$$= 11.18$$

Provides a specific example of the Pythagorean relation for right-angled triangles

Mathematics – Annotated student work samples

b. Let p , q and r be three positive integers. Find a relation between p , q and r which means that these numbers could represent the lengths of the three sides of a triangle, for any kind of triangle.

Sketches a case for which the corresponding values would not form the side lengths of a triangle

Initially writes a relation using \geq then changes this to $>$ assuming r corresponds to the longest side

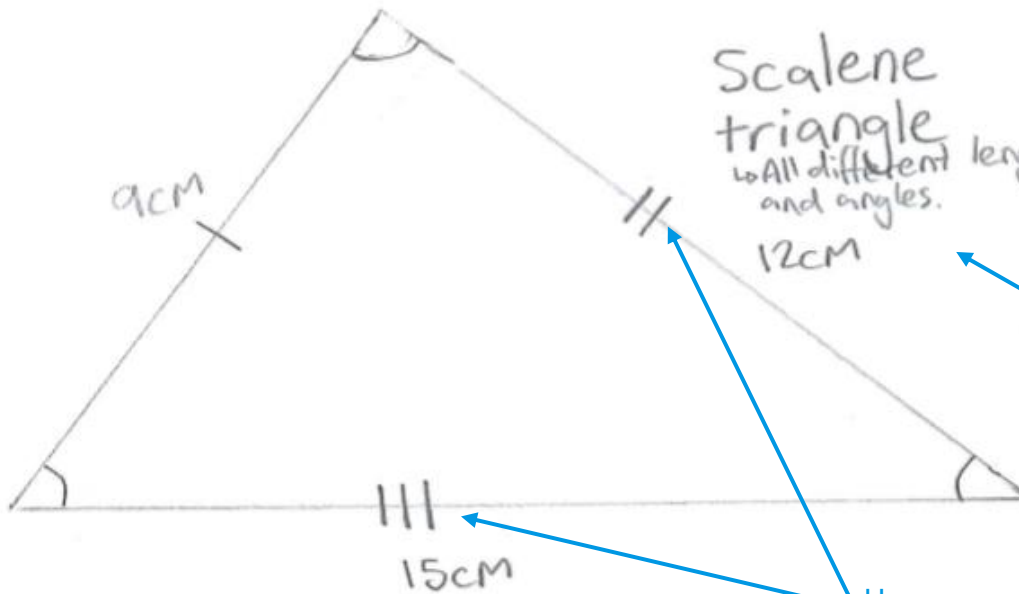

Sketches a case corresponding to a collapsed triangle

Mathematics – Annotated student work samples

Part 2

c. Construct a triangle with side lengths of 9, 12 and 15 centimetres.

Identify the type of triangle that you have constructed.

acute angle triangle

Scalene triangle
↳ All different lengths and angles.

Identifies the triangle as scalene with acute angles

Uses geometric conventions to indicate angles and sides

Part 2

c. Construct a triangle with side lengths of 9, 12 and 15 centimetres.

Identify the type of triangle that you have constructed.

Identifies a right-angled triangle

This is a right angled triangle
 $15^2 = 9^2 + 12^2$
 $225 = 225$
 ↳ It follows the pythagoras theorem
 $C^2 = a^2 + b^2$

Uses Pythagoras's theorem to verify the triangle is right-angled

Mathematics – Annotated student work samples

Part 2

c. Construct a triangle with side lengths of 9, 12 and 15 centimetres.

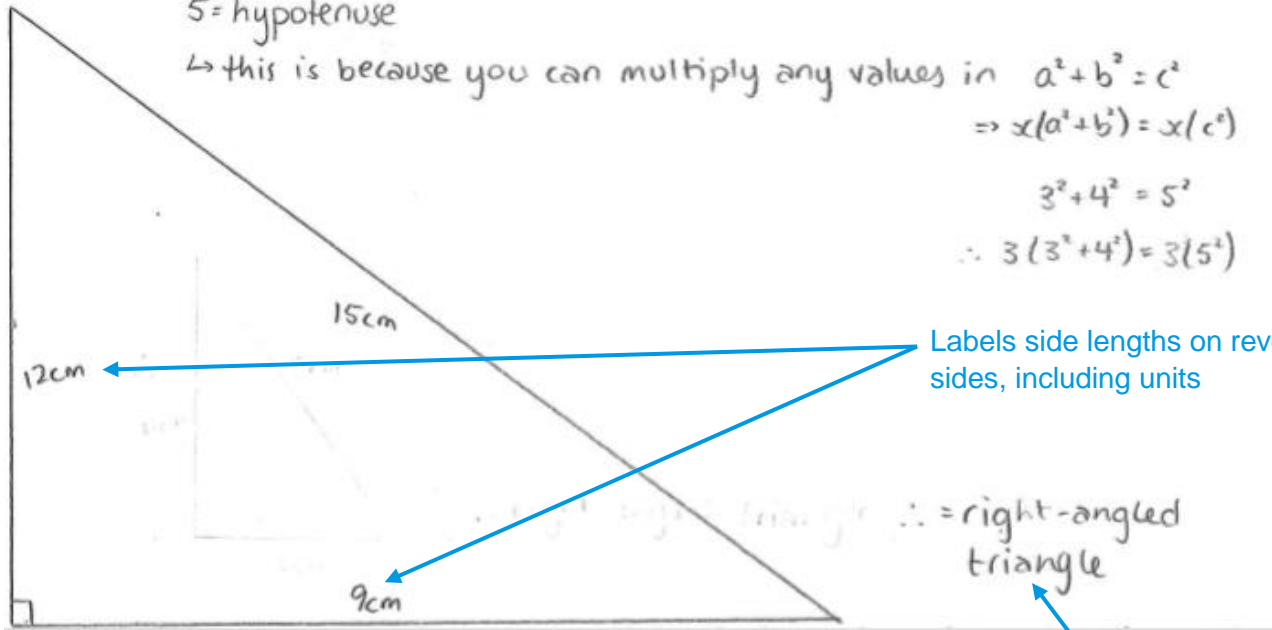

Identify the type of triangle that you have constructed.

$$\rightarrow \frac{9}{3}, \frac{12}{3}, \frac{15}{3} \Rightarrow 3, 4, 5 \text{ (pythagoras triple)}$$

5 = hypotenuse

↳ this is because you can multiply any values in $a^2 + b^2 = c^2$

$$\Rightarrow x(a^2 + b^2) = x(c^2)$$
$$3^2 + 4^2 = 5^2$$
$$\therefore 3(3^2 + 4^2) = 3(5^2)$$

Identifies and verifies the triangle as a scaling of the 3, 4, 5 Pythagorean triple

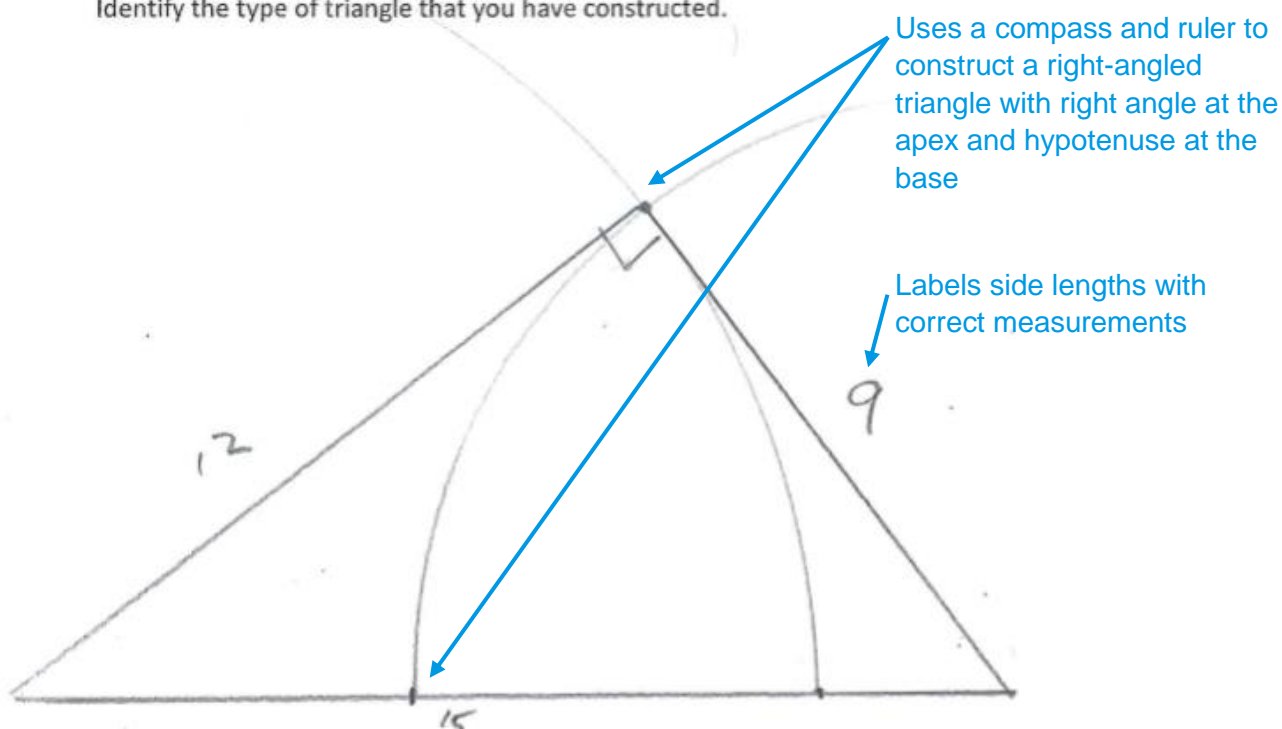

Labels side lengths on reverse sides, including units

Identifies the triangle as a right-angled triangle

Part 2

- c. Construct a triangle with side lengths of 9, 12 and 15 centimetres.

Identify the type of triangle that you have constructed.

Mathematics – Annotated student work samples

d. Find some other combinations of integer side lengths that can be used to construct the same type of triangle and explain why this is the case.

$$3^2 + 4^2 = 5^2 \quad \leftarrow \text{we know that this is true}$$

$$\therefore (3 \times 2)^2 + (4 \times 2)^2 = (5 \times 2)^2$$

$$3^2 \times 4 + 4^2 \times 4 = 5^2 \times 4$$

this can then be factorised:

$$4(3^2 + 4^2) = 4(5^2)$$

$$3^2 + 4^2 = 5^2$$

\therefore we can multiply all sides by the same number, and still have a pythagoras triple:

$$\times 2 \Rightarrow 6, 8, 10 \text{ cm}$$

$$\times 4 \Rightarrow 12, 16, 20 \text{ cm}$$

$$\times 5 \Rightarrow 15, 20, 25 \text{ cm}$$

$$\times 6 \Rightarrow 18, 24, 30 \text{ cm}$$

etc. (every set of lengths of form $3x, 4x, 5x$) \leftarrow where x is any positive value

Uses a particular example to show the original relation is true with scaling

Lists a set of triangles based on scaling from a 3, 4, 5 triangle

Provides a general form

d. Find some other combinations of integer side lengths that can be used to construct the same type of triangle and explain why this is the case.

$$9^2 + 12^2 = 15^2$$

9, 12, 15 are part of the 3, 4, 5 type of pythagorean triads.

Assuming similar triangles:

3, 4, 5

6, 8, 10

12, 16, 20

15, 20, 25

etc

other pythagorean triads

5, 12, 13

etc

8, 15, 17

etc

7, 24, 25

etc

Identifies a set of similar right-angled triangles based on scaling from a 3, 4, 5 triangle

Identifies other combinations (Pythagorean triads) that can similarly generate other related triangles

Where to next for the teacher?

When the task on which these annotated student work samples is based has been used as a classroom activity, there is opportunity to gather data on student achievement to help inform further teaching.

An analysis of student responses, on an individual, group or whole class basis, can be used to develop and direct student learning with respect to the following content.

For students needing to review underpinning knowledge and skills at [Level 8](#)

- Develop the conditions for congruence of triangles (VCMMG292)
- Establish properties of quadrilaterals using congruent triangles and angle properties, and solve related numerical problems using reasoning (VCMMG293)

For students consolidating knowledge and skills at [Level 9](#)

- Apply trigonometry to solve right-angled triangle problems (VCMMG320)
- Use similarity to investigate the constancy of the sine, cosine and tangent ratios for a given angle in right-angled triangles (VCMMG319)

For students moving on to new knowledge and skills at [Level 10](#)

- Solve right-angled triangle problems including those involving direction and angles of elevation and depression (VCMMG346)
